

Slide into the future with

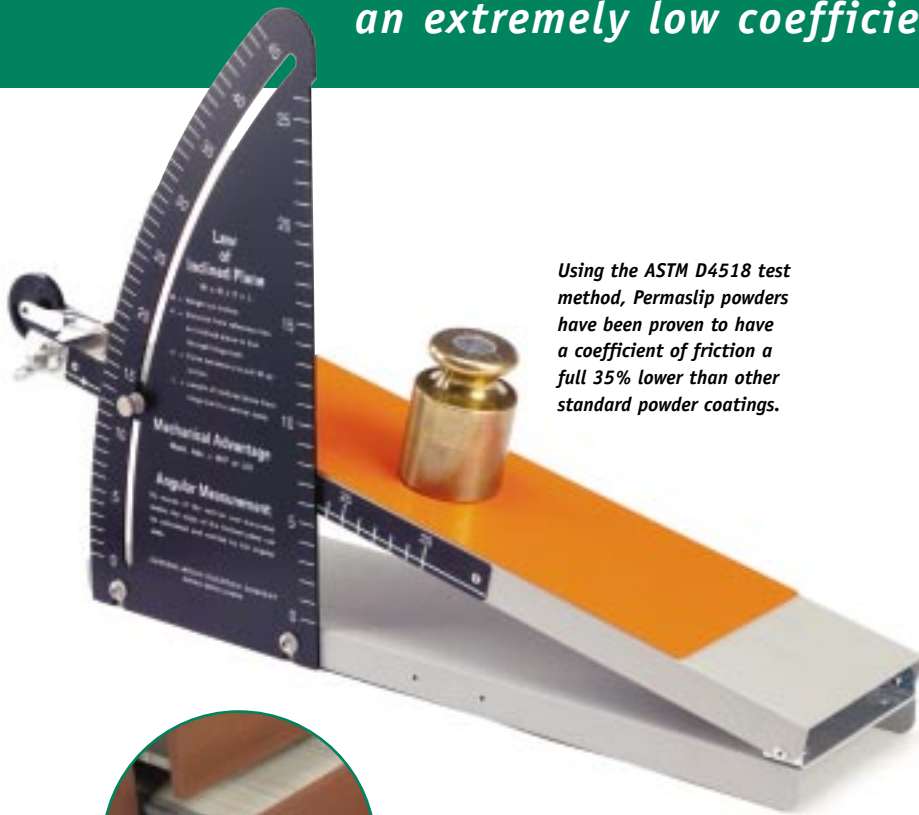

Protech's line of
Low Friction powder coatings

Powder Coatings for Life

Permaslip powders are formulated to produce coatings that exhibit an extremely low coefficient of friction.

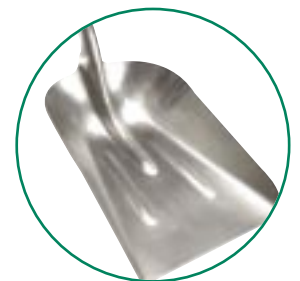

Using the ASTM D4518 test method, Permaslip powders have been proven to have a coefficient of friction a full 35% lower than other standard powder coatings.

Their low coefficient provides these powders with excellent low-friction characteristics ideal for certain applications. This allows interlocking or meshing products to slide effortlessly within each other. Shopping carts can be fitted together without fear of chipping. Drawer slides glide effortlessly without the coating being eroded away. Permaslip powders are also formulated to produce an extremely durable and chip resistance finish. This hardness, combined with the low coefficient of friction, makes Permaslip the perfect application for earth moving machinery and for commercial snow removal equipment.

Permaslip powders come in a wide range of colors and textures and are formulated to provide excellent chemical, stain, and scratch resistance. Like all Protech powders, they are environmentally friendly and contain no solvent emissions.
