MANAGEMENT & TASK SEATING

GLOBAL*Contract*

*Kin combines sophisticated European design with advanced ergonomic features.*

The Kin family of task and side chairs offers advanced ergonomic features combined with sophisticated European design, with its distinctive back texture, featuring the countries of the world embossed into its molded plastic backrest. The Kin task chair incorporates an advanced mechanism, which was designed for durability, ergonomic support, simplicity of function, and aesthetic appearance, with easy access to all of the controls.

The Kin chair synchro-tilter enables the user to adjust the seat in a series of positions including a forward upright position which is ideal for typing. The molded plastic backrest delivers firm support, while the upholstered back option provides exceptional all day comfort. To ensure proper lumbar support, the backrest is height adjustable.

The arm caps on the task chair are soft to the touch but made from durable self-skinned urethane. The arm caps are height, width and depth adjustable. Width adjustable arms allow outward movement of arm rests to match shoulder breadth. Standard frames are available in black. The task chair bases are standard in black. Options include polished aluminum and tungsten. The Kin side chair is available to complement this series. Stackable metal frames provide support and durability. Stacks three high. Standard frames are available in black.

**Arm Depth**  
The depth of the arm rest can be adjusted to accommodate the user's needs by sliding the armrest forward or back.

**Arm Width**  
The width of the armrest can be adjusted from a seated position by releasing the levers located under the seat.

**Arm Pivot**  
Rotating the front end of the armrest inwards or outwards provides the user with better arm support while typing.

**Arm Height**  
The height for both arm rests can be independently adjusted with just a push of a button located on the underside of each arm rest.

**Seat Back Tilter**  
The seat back tilter enables the user to adjust the backrest in a series of positions. The tension control can be easily reached while in a seated position.

**Seat Slider**  
The seat slider on the Kin chair adjusts the seat depth to suit various size of bodies. Incorporating the handle of the seat slider into the seat helps reduce cluttering of controls.

# Kin
