

**New products:**

Grespania's new Krimiss Series was developed exclusively for the American market. The elegance and sophistication of marble is captured by emulating imported natural stone. However Grespania maximizes the look of marble with three color options: Beige (the natural color of the sample stone), Ivory (a light, clean color) and sinter which resembles a silver travertine. Krimiss is available in wide ranging formats in floor tile and semi-polished and matte finishes. The line also includes a 10 x 16 wall tile in gloss finish which is one of Grespania's first wall tiles created using inkjet printing.

Highlights:

Grespania's reputation rests on the solid foundations of innovation, quality, service and responsibility. Since 1976, continuous investment and the constant application of the latest advance in the production of wall coverings and flooring have secured the company's position as a world leader. Its designs are varied and versatile and the latest collections are suited to new uses and settings. Grespania has three factories incorporating the latest technologies and most advanced manufacturing processes devoted to the production of porcelain tiles and white-bodied wall tiles.

Between 2005 and 2008 it put two new production plants into operation. It replaced the Castellón floor tile works with a state of the art factory to produce porcelain stoneware using the most advanced manufacturing techniques. Among the improvements introduced in this plant is the new "technological tower", a highly sophisticated structure that offers unlimited versatility for the production process. The tower—twenty-four metres (almost 79 feet tall) —consists of four levels where the clays for the porcelain stoneware are blended, batched and distributed according to whether they are to be used in glazed or "technical" tiles and according to the effect it is desired to obtain—scales, granulation or veins, amongst others. The whole process is completely automated. In 2008 Grespania opened a new plant in Nules to produce monoporosa wall tiles, which included the enlargement of the "intelligent" warehouse.

The warehouse is completely computerized, covers a surface area of 22,000 square metres and has a storage capacity of 60,000 pallets. In addition, it contains an intelligent zone in which 27,000 pallets can be stored at 17 levels. In the intelligent zone each pallet is entered into stock, tracked and managed by a powerful computer system that receives the orders to be dispatched, locates and extracts the desired products and sends them to the order-preparation section. Furthermore, the computer system can provide information for any client, anywhere in the world and at any time, on the availability of material in our warehouse and order status in real time.
