

Kwalu Handrails

1. Choose the desired handrail style: Transitional, Catena or Round.
2. Specify the overall length, in feet, of the handrail system you require, or the sum total of all individual sections between returns and corners. We will add 10% to this number (multiply by 1.1) to allow for scrap produced during the installation, then round that total up to the next nearest unit of measurement (increments of 12 feet).
3. Specify the exact number of returns, occurring at every point at which the system comes to a stop.
4. Specify the exact number of inside and outside corners, and the angle of each: 90° or 135°. Custom angles are not available. When wall corners are other than 90° or 135°, install handrail with returns on either side of the corner.
5. Specify the wood grain color.
6. Specify if the handrail system will be covering any curved or arced walls. If yes, you must provide us with the following information for each individual curved section required:
 - a. Length in feet
 - b. Whether the arc is inside ("concave" – apex is farther away than the edges) or outside ("convex" – apex is closer than the edges)
 - c. The radius of the arc in feet and inches. (Note: minimum radius allowable is 10')
7. Specify if you would like Kwalu to perform the installation, or if an independent installer will be used.
