

Relay™

Intuitively designed to support information technology
and the caregiver work process at the point of care.

The rigorous demands of the clinical environment require a product that is designed to withstand the trials of daily use. Relay provides a smart solution that moves and operates with a single handle touch point, eliminating the need for adjusting the keyboard and monitor separately, resulting in one continuous motion. This allows the caregiver to focus on what's most important – their patient.

At hand and accessible when needed and able to dissolve into the background when not in use, Relay is designed to support the caregiver work process in even the smallest spaces. And when used throughout a facility in conjunction with Pocket and Sync, healthcare organizations have a holistic, insightful solution that supports information technology in the clinical environment.

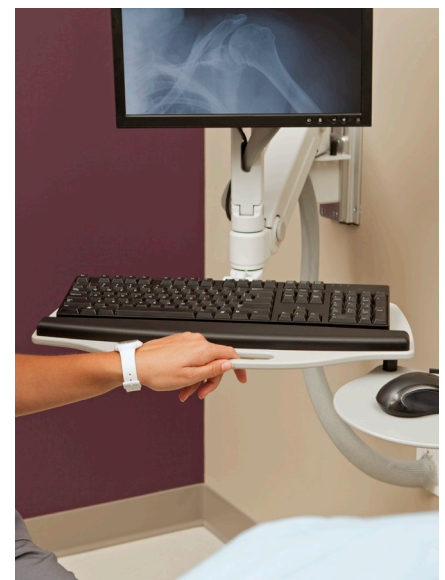

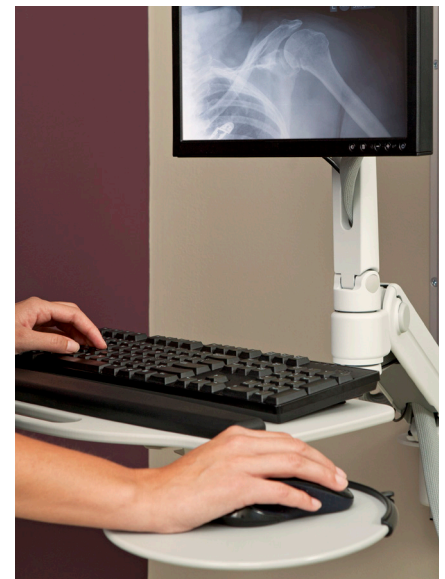

Features

- Smooth range of motion achieved by single-handed adjustments
- 14" vertical adjustment to transition from sitting to standing
- Counterbalance adjustment to support LCD monitors from 17" to 26" and no keyboard drift
- 55" reach into space to promote eye contact with patient
- Stores 7" from wall when not in use
- Intelligently designed cable management
