LIFECYCLE IMPACT CATEGORIES

The environmental impacts listed below were assessed throughout the product's lifecycle – including raw material extraction, transportation, manufacturing, packaging, use, and disposal at end of life.

ATMOSPHERE		WATER		EARTH		
Global Warming Potential refers to	Ozone Depletion Potential is the	Photochemical Ozone Creation Potential	Acidification Potential is the result of human-	Eutrophication Potential occurs when	Depletion of Abiotic Resources (Elements)	Depletion of Abiotic Resources (Fossil Fuels
long-term changes in global weather patterns – including temperature and precipitation – that are caused by increased concentrations of greenhouse gases in the atmosphere.	destruction of the stratospheric ozone layer, which shields the earth from ultraviolet radiation that's harmful to life, caused by human-made air pollution.	happens when sunlight reacts with hydrocarbons, nitrogen oxides, and volatile organic compounds, to produce a type of air pollution known as smog.	made emissions and refers to the decrease in pH and increase in acidity of oceans, lakes, rivers, and streams – a phenomenon that pollutes groundwater and harms aquatic life.	excessive nutrients cause increased algae growth in lakes, blocking the underwater penetration of sunlight needed to produce oxygen and resulting in the loss of aquatic life.	refers to the reduction of available non- renewable resources, such as metals and gases, that are found on the periodic table of elements, due to human activity.	refers to the decreasing availability of non- renewable carbon- based compounds, suc as oil and coal, due to human activity.
