

Optional Added Finish and Backing Specifications

Designtex products have been designed with performance in mind. Our designers carefully consider the material's content makeup to provide certain characteristics. Before applying any additional finishing, consider whether any finishes have already been applied and if it is truly required to meet your needs. Designtex advocates for limiting the use of additional chemistry when it is not strictly necessary.

Finish

Stain Resistant

A PFAS free stain resistant treatment applied to fabric to resist water based soils and stains.

Backing

Fluid Barrier

This barrier prevents fluids from permeating through the fabric, thereby protecting the furniture.

Acrylic

Some manufacturers may require an acrylic backing to be added for application. Consult with the furniture manufacturer about which option is best.

- Light Acrylic Backing – an acrylic backing for panel applications that improves stability and aides in the ease of handling during manufacturing processes.
- Medium Acrylic Backing – an acrylic backing for upholstery applications that improves stability, reduces fraying and curling, and provides durability.
- Heavy Acrylic Backing – an acrylic backing for upholstery applications that improves stability, seam slippage, reduces fraying and curling, and provides durability. Use this on upholstery fabrics for furniture that require durability and shape retention.
